

# i-STAT Alinity | FACT SHEET

## THE NEW GENERATION OF POINT-OF-CARE TESTING

- Quick results to help assess a patient's medical condition and provide faster treatment decisions
- Efficiencies to streamline testing and focus on quality patient care while facing limited staff or budget
- Access to lab-quality testing where and when care is needed

To meet these testing needs, here's where with-patient diagnostics come into play.

## HAZARD OF POINT-OF-CARE TESTING?

Point-of-care testing (POCT) is a critical component of patient care, providing rapid results for a variety of tests. However, POCT is not without its challenges. Limited staff resources, budget constraints, and the need for lab-quality testing in the point-of-care setting can create a hazardous environment for patients. The i-STAT Alinity device is designed to address these challenges, providing quick, accurate results in a portable, handheld format. It is a true point-of-care device, designed for use in the patient's room, at the bedside, or in the emergency department. The i-STAT Alinity device is a true point-of-care device, designed for use in the patient's room, at the bedside, or in the emergency department. It is a true point-of-care device, designed for use in the patient's room, at the bedside, or in the emergency department.
